

Abstract of the Disclosure:

A modular house toy includes a fixed supporting structure made of a solid floor, a solid ceiling, a solid back wall connecting the floor to the ceiling, and an open arch connecting the floor to the ceiling. The back wall and/or the arch permanently connect the floor to the ceiling in respective connection planes. A modular house toy configuration includes at least two fixed supporting structures. One fixed supporting structure is removably connected to another in six positions. Preferably, the floor and the ceiling have the same shape and the back wall and the arch have the same shape to allow repetitious and modular interlocking of one modular house toy to another module house toy. Wall and arch extensions are inserted into floor depressions and other wall and arch extensions are inserted into ceiling depressions to connect the floor to the ceiling.
